"Psychoneuroimmunity of Mind-Body Interventions in Depression"

CURRICULUM VITAE

Professor Su Kuan-pin leads the Mind-Body Interface Laboratory, focusing on clinical trials, molecular biology, and genetics, combining non-invasive brain stimulation, acupuncture, and integrative natural nutrition therapy for the treatment of brain disorders such as depression. Professor Su's research focuses on omega-3 polyunsaturated fatty acids in treating comorbidities of major depressive disorder, making him one of the most cited scholars in the field globally. He is the Vice President of the International Society for Nutritional Psychiatry (ISNPR) and the Editor-in-Chief of its official journal, "Nutritional Psychiatry." His team spans public health and bioinformatics, applying artificial intelligence (AI) and large language modeling (LLM) technologies to psychiatric clinical practice, teaching, and research, developing digital tools for screening, diagnosing, and predicting gene expression. Professor Su also promotes international collaboration and academic exchange, founding the Nutritional Psychiatry Research Society, participating in numerous international research projects, and receiving numerous domestic and international awards. Currently, he serves on the board of the non-profit organization "Ming-Yi Foundation," dedicated to developing digital mental health care and supporting youth and vulnerable groups. He is also a member of the "Presidential Office Healthy Taiwan Promotion Committee," assisting the nation in promoting mental health policies, fostering equitable access to mental health care, and advocating for the impact of the digital pandemic on mental health. Prof Kuan-Pin Su and his research team, the Mind-Body Interface Research Center (MBI Lab & Care), focus on Translational Brain Research, connecting bedside to bench with novel interdisciplinary approaches of AI technology, neuroimaging, genomics, randomized-controlled trials (RCTs), cellular and molecular biology. He integrates clinical significance (eg pharmaceuticals, nutraceuticals, phytochemicals, rTMS, photobiomodulation, and acupuncture) with investigations of basic sciences. Prof Su's groundbreaking research has not only revolutionized the treatment guidelines for depression but has also pioneered the exciting field of nutritional psychiatry.

Psychoneuroimmunity of Mind-Body Interventions in Depression

Dr. Kuan-Pin Su

Department of Psychiatry and Neuroscience, College of Medicine, China Medical University, Taiwan. Center for Psycho-Mental Interface Research, China Medical University Hospital. Email: cobol@cmu.edu.tw

Abstract

The global burden of depression demands novel approaches targeting underlying biological, psychological, and social dysregulations. Depressed patients with chronic low-grade inflammation represent a distinct major depressive disorder (MDD) subgroup, making anti-inflammatory pathways a primary target to improve therapeutic efficacy. Anti-inflammation serves as a core molecular mechanism for various mind-body interventions, including omega-3 polyunsaturated fatty acids (n-3 PUFAs), acupuncture, exercise, and mindfulness. Evolutionary dietary shifts featuring a drastic decline in the n-3 to n-6 PUFA ratio promote chronic systemic inflammation, exacerbating modern depression and medical comorbidities. Furthermore, fine-tuning essential signaling molecules like eicosapentaenoic acid (EPA), endocannabinoids (eCBs), and melatonin offers a powerful translational strategy to regulate circadian rhythms, neuroplasticity, and blood-brain barrier integrity. This presentation provides an overview of our recent clinical and pre-clinical translational research, highlighting how orchestrating these psychoneuroimmunological pathways can facilitate therapeutic outcomes and offer actionable insights for daily lifestyle interventions in depression.

Keywords: Major depressive disorder, anti-inflammation, mind-body interventions, omega-3 polyunsaturated fatty acids, acupuncture, exercise, mindfulness.
